A LEAP AHEAD SINCE 1975

PivaBend

PivaBend

Bending Center

The PivaBend concept brings cycle times for bending to the same level with punching times of work pieces for great total productivity.

Our bender is based on the wing forming folding method, which makes it material friendly for pre-painted and stainless steel and aluminum. We'll equip it for sections, panels or wrapper type work pieces based on your production requirements.

PivaBend is more efficient than other sheet metal bending methods because the bender bends negative and positive bends set for each edge of the work piece, and the sides and the ends are bent at the same time.

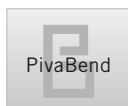

It's flexible because angles, dimensions and sequences are all programmable. PivaBend processes different work pieces one-off and as large batches. The automated tool change system eliminates manual setups.

Versatile solutions

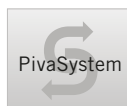

Industries that use PivaBend include office furniture, heating and ventilation, air conditioning, domestic appliances, shelving, lighting fixtures, electronics, vehicle, accessories, telecommunications, subcontracting, enclosures.
